65TH MEDICAL GROUP, FASCOM

ECTOPARASITE SURVEY OF SOUTH KOREA

PROGRESS REPORT 

JULY 1968

FOREWORD

MANY LONG HOURS OF DEDICATED WORK BY THE PERSONNEL IN THE SURVEY SECTION OF THE 5TH PREVENTIVE MEDICINE UNIT HAVE BEEN CONTRIBUTED IN THE PREPARATION OF THIS PUBLICATION. UNDER THE DIRECTION OF CAPTAIN J. WANLESS SOUTHWICK, THE SECTION SURVEYED MANY GEOGRAPHICAL AREAS IN THE REPUBLIC OF KOREA FOR DATA ON ECTOPARASITES AND THEIR HOSTS. EXCELLENT SUPPORT WAS RENDERED BY UNITED STATES ARMY UNITS, UNITED STATES AIR FORCE, AND THE REPUBLIC OF KOREA NAVY IN ALL AREAS SURVEYED. IT IS HOPED THAT THE INFORMATION CONTAINED HEREIN WILL BE OF USE FOR REFERENCE INFORMATION IN FUTURE ENDEAVORS OF RESEARCH IN THE FIELD OF DISEASE PREVENTION IN THE REPUBLIC OF KOREA.

INTRODUCTION

The purpose of this report is to consolidate the data available at 5th Preventive Medicine Unit pertaining to ectoparasites of South Korea. For many years data about ectoparasites has been collected in conjunction with epidemic hemorrhagic fever studies, but these data have often been lost due to frequent turnover of military personnel.

Data for this report are from two main sources, (1) from microscope slides prepared in years prior to 1967 and (2) from a large scale ectoparasite survey during 1967.

No real attempt has been made to analyze data or to draw conclusions. It is hoped that future workers concerned with ectoparasites of South Korea will be able to use these data as a foundation upon which to build. Microscope slides of ectoparasites, skulls and skins of hosts and original data cards have been preserved in the laboratory for future reference by subsequent researchers.

Because of the fear that these data would be lost, the preparation of this report was considered essential. Some urgency was attached to its preparation because of the impending departure of the officer-in-charge of the Survey Section. This urgency precluded many refinements that otherwise would have been accomplished, for example: numerical sequence of hosts listed on raw data sheets was not always maintained and attempts to alphabetize were usually thwarted. Arrangement of animals in logical taxonomic sequence was hardly attempted. This urgency will probably be revealed as the father of undiscovered errors despite strict efforts to attain accuracy.

Methods and Procedure

The 1967 ectoparasite survey was accomplished by field teams of four men. The field team used a laboratory van mounted on a 2 1/2 ton truck, and a 1/4 ton truck (jeep) with trailer. They moved to a pre-selected site and collected small mammals and occasionally birds of the area for seven (7) days. Snap traps and shotguns were the main collection tools used. Captured animals were given a number, placed in a bag with chloroform, and placed in a freezer for storage. A data card on each host was initiated in the field.

Frozen hosts were flown to the 5th Preventive Medicine Unit Laboratory where they were maintained in a deep freezer until they could be processed for ectoparasites. Ectoparasites were combed from the thawed hosts and placed with the host number in an alcohol vial. The host animal skulls and skins were preserved for future taxonomic reference. Sometimes skins were destroyed by shrews feeding on the captured animals in the field, and sometimes hair slippage was so bad that skins were thrown away. Ectoparasites were mounted on microscope slides by taxonomists and classified.

The survey began in September 1967 in the central part of the country, moved across the peninsula near the DMZ to the east coast and then down the east coast to Pusan and Cheju Island.

Results

Data for each host were recorded on a single data card. Taxonomic identifications of both ectoparasites and hosts were checked by other

entomologists and mammalogists wherever possible. Some uncommon specimens were sent to expert taxonomists for identification. Unfortunately some of the information from experts was not available at the time of printing, therefore identification of some specimens, especially the ticks, was incomplete as can be seen from the raw data sheets.

Data for this report is presented in two ways (1) check list of ectoparasites found in Korea and (2) raw data of each ectoparasite collection record. Also preliminary keys to the laelaptid mites, chigger mites and lice are presented.

Acknowledgments

Many individuals participated in the 1967 survey and in preparing this report. The life blood of the survey was the field collection team who collected host animals. Team members included:

Mr. Chong, Chun-sik	Sp4 Catanello, Joseph V.
Sp5 Butterfield, Allan A.	Sp4 Falls, Daward L.
Sp5 Cox, George R.	Sp4 Johnson, Vernon
Sp5 Jenkins, Johnny V.	Sp4 McFarland, Steven L.
Sp5 Killin, Robert D.	PFC Drysdale, James R.
Sp5 Townsend, Richard W.	PFC Jang, Ki-je
SGT Choi, Nam-ha	PFC Morton, Ronald A.
SGT Jo, Young-ho	PFC Ogle, Lea B.
SGT Yang, Won-suk	PFC Sims, Steven R.

Dr. No, Byong-ui was responsible for processing the host animals for ectoparasites, for mounting host skins and for saving and tagging host skulls. Dr. No accomplished the majority of this work himself although, he utilized enlisted personnel of the laboratory to aid in keeping up with the heavy volume of specimens. He also made primary taxonomic identification of host mammals.

Processing, mounting and identification of ectoparasites was accomplished by the Korean Entomologists employed by the Laboratory. Their taxonomic skill was the foundation of this study. Authorship of this work should be accorded these taxonomists:

Mr. Yu, Hyo-sok
Mr. Chong, Chun-sik

Mrs. Cho, Hu-cha
Mrs. Chu, Chong-ae

After the identifications had been made and the data cards completed, the responsibility for assembling the data fell upon the officer-in-charge who relied upon PFC Ronald A. Morton for transcription of data from cards to data sheets. PFC Morton did the typing for the report. Mr. Yu, Hyo-sok played an important role in reviewing transcribed data for errors. Mr. Yu also prepared the taxonomic keys presented in this report.

Special thanks go to those who aided in the identification of ectoparasites and hosts: Dr. Edwin L. Tyson and Dr. Won, Pyong-hooi for their help in identifying the mammal hosts; LTC Vernon J. Tipton, Dr. Robert Traub, Dr. Glen M. Kohls and Dr. M. Nadchatram for their help in identifying ectoparasites.

Special help in meeting transportation requirements were greatly obtained from 377th Medical Company (Air Ambulance), 55th Aviation Company (Army), 2nd Aviation Battalion A Company, 7th Aerial Port Squadron Detachment 55 (Air Force), and Chief of Naval Operations, Republic of Korea Navy.

KEY TO KOREAN MESOSTIGMATIC MITES
(Based on Females)

- Pilus dentalis 8 to 10 branched, not inflated basally; epigynial plate with more than 80 accessory setae; metapodal plate crescent shaped, longer than the length of anus . . . Haemogamasus kusumotoi

10. - Chelicerae elongate, attenuated apical two-thirds with a pair of needle-like chelae; coxa II without an anterior dorsal spur
 (DERMANYSSINAE) Dermanyssus gallinae

- Chelicerae retain uniform thickness with scissor-like chelae; coxa II with anterior dorsal spurs . . . (MACRONYSSINAE) 11

11. - With Two dorsal shields subequal; primarily parasitic on bats . . .
 Genus Steatonyssus

- With one dorsal shield 12

12. - With ventral spurs on coxae II and III
 (Genus Hirstionyssus) 13

- Without ventral coxal spur 14

13. - Tarsus II with two short, peg-like setae ventrally; third pair of sternal setae separated more than twice as far as first pair of sternal setae Hirstionyssus carnifex
 - Tarsus II without peg-like setae; third pair of sternal setae separated usually twice as far as first pair of sternal setae.
 Hirstionyssus isabellinus

14. - Epigynial plate evenly rounded posteriorly; dorsal plate more or less parallel-sided before distal one fifth; coxae II and III with a slight semicircular protuberance posteriorly; parasites of bats
 Genus Ichoronyssus

- Epigynial plate narrowed posteriorly with pointed tip; dorsal plate convex-sided and tapered posteriorly; coxae II and III without semicircular protuberance (Genus Ornithonyssus) 15

15. - Sternal plate with 3 pairs of setae; epigynial plate gradually tapered posteriorly; setae on dorsal shield almost equal in size to those of unarmored dorsal integument. Ornithonyssus bacoti

 - Sternal plate with 2 pairs of setae, occasionally a third pair of setae touch posterolateral corner of sternal plate; epigynial plate abruptly tapered before basal one third to posteriorly; setae on dorsal shield conspicuously smaller than those of unarmored dorsal integument. * * * * Ornithonyssus sylviarum

KEY TO THE LARVAL TROMBICULID MITES OF SOUTH KOREA

22. - Scutum broad with PW more than 80 microns; posterior margin of scutum not sinuate; dorsal setae 32 - 36 in number 23
- Scutum small with PW about 70 microns; posterior margin of scutum biconvexed with median sinus; dorsal setae 27 - 32 in number
 • • • • • Leptotrombidium pumilis
23. - Scutum consistently broad, PW about 90 microns; dorsal setae long about 70 microns; dorsal setal formula 2-8-6-6-6-4-2
 • • • • • Leptotrombidium zeta
- Scutum medium, PW about 80 microns; dorsal setae about 55 microns; dorsal setal formula 2-8-6-6-6-4-4
 • • • • • Leptotrombidium subintermedia
24. - Scutum less than twice as wide as long; palpal claw four pronged; dorsal setae 40 - 46 in number with arrangement 2-10-8-8-8-4-2 . .
 • • • • • Leptotrombidium hiranumai
- Scutum more than twice as wide as long; palpal claw three pronged; dorsal setae 85 - 105 in number arranged irregularly
 • • • • • Leptotrombidium halidasys
25. - Scutum entirely on the surface of dorsal integument. 26
- Scutum partially submerged beneath dorsal integument on posterior margin (Genus Neoschongastia) 30
26. - Base of anteromedian seta in advance of a line connecting bases of anterolateral setae; mastitarsala III present.
 • • • • • . (Genus Ascoshongastia) 27
- Base of anteromedian seta not in advance of a line connecting bases of anterolateral setae; mastitarsala III absent. 28
